TITLE: Automatic address distributing system

Detailed Description Text (22):

FIG. 2 is a diagram illustrating a typical address-pool DB 102 for storing network-configuration information including address information distributed by the DHCP server to terminals connected to the LAN. Reference numeral 21 shown in the FIG. 2 is an address field for holding address information distributed by the DHCP server 100 to DHCP conforming (mobile) terminals 115 connected to the LAN 113. Reference numeral 22 is a distribution-status field containing either "Done" status to indicate that an address in the associated address field 21 has been distributed to a DHCP conforming (mobile) terminal 115 connected to the LAN 113 or "Not yet" status to indicate that an address in the associated address field 21 has been assigned to a DHCP conforming (mobile) terminal 115. Reference numeral 23 is an additional-information field for holding network-configuration information such as a sub-network address and a domain name associated with the address held in the corresponding address field 21. Here, the initial status held in all the distribution-status fields 22 is "Not yet".

Detailed Description Text (59):

In this way, the automatic address distribution system provided by the present invention is capable of avoiding distribution of an address that would duplicate an address already used by an existing terminal without regard to the operation status of the terminal already in use in the LAN. In addition, it is possible to obtain the use status of a distributed address assigned to a mobile terminal and continue the use of the distributed address in a network of a movement destination. Further, an address distributed to a moving mobile terminal can be used continuously to a movement destination after the mobile terminal has moved thereto without worrying about the validity period of the distributed address.
